
Continuous and sparse single-hit models generate distinct patterns of reciprocal CNV effects
A Observed height effects
Asymmetry
(lower-left)
Pure mirror expectation
Mirror
Asymmetric
DUP effect (SD)
DEL effect (SD)
B Continuous model: increasing small-effect load
Low (0.25×)
Mixed
(1×)
High
(2×)
C Single-hit model: increasing hit frequency
D Best-fit displacement distributions
Positive = lower-left
Observed Sacks loci
Mirror alone
continuous
sparse single hit
Density
Directional distance from mirror line (SD)
E Observed bmi effects
Pure mirror expectation
Reciprocal CNVs
Asymmetry
(upper-right)
F Continuous model: increasing small-effect load
G Single-hit model: increasing hit frequency
H Best-fit displacement distributions
Positive = upper-right
