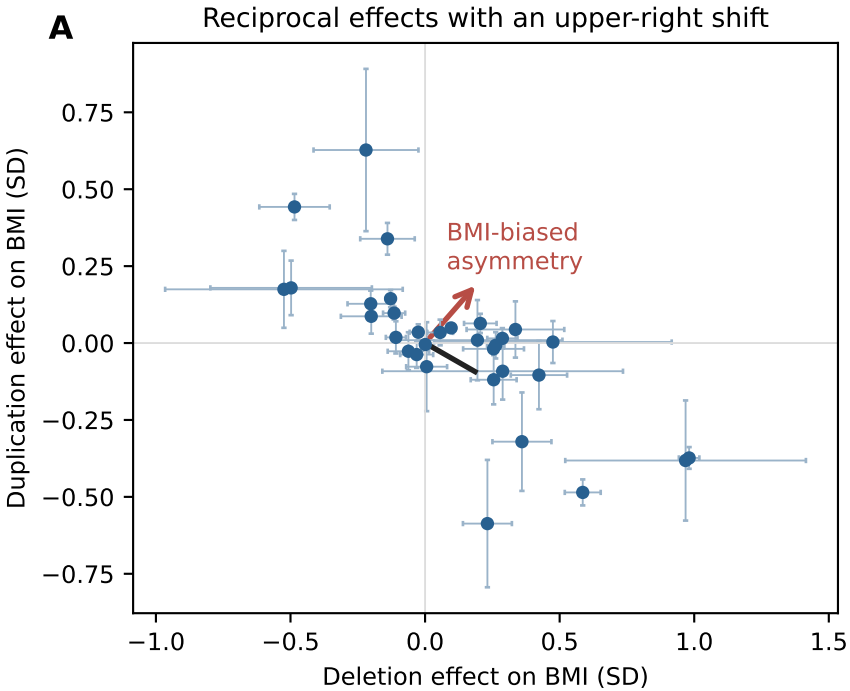
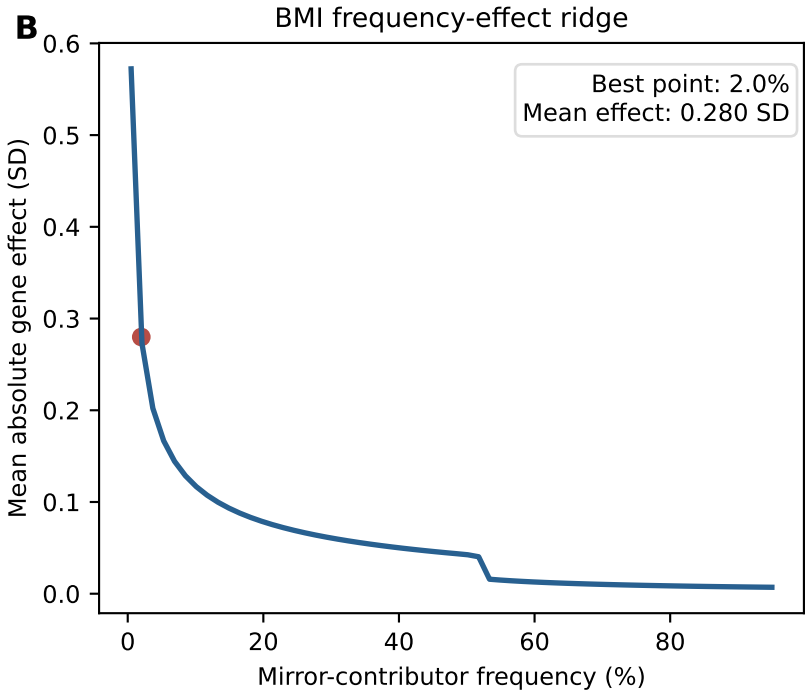
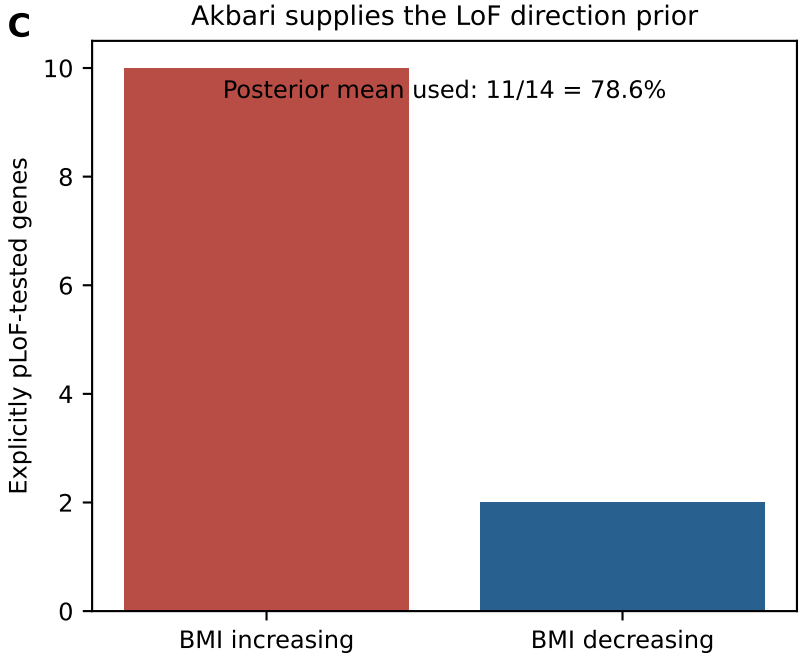
BMI: mirror-gene model fitted to exact Sacks et al. reciprocal CNVs







D

BMI mirror model

Akbari-informed probability that LoF increases BMI: 78.6%.

Fitted contributor frequency: 2.0%
Mean absolute contributor effect: 0.280 SD
Expected contributors in the average CNV: 0.50
Duplication/deletion magnitude ratio: 0.50

Observation: the mirror component explains the strong negative DEL-DUP relationship, but predicts a more negative average DUP effect than the observed near-zero mean.
