Head-circumference trajectories by BMI in 16p11.2 and 22q11.2 carriers, 0-18 y (all visits, incl. full SVIP longitudinal series)

A (top). Mixed GAM ± 95% CI, child random intercept; 16p11.2 del BMI > 90th vs rest, other loci ≥ 70th vs ≤ 30th centile (child's mean BMI Z from age 2).
UK90 head-circumference Z and WHO BMI Z recomputed from raw values for all cohorts (SVIP v10, Cardiff, G2MH, SSC). Grey = 8-13 y.

B. Prospective: does high BMI at a visit precede faster head growth?
