Supplementary: ICV by BMI and growth by ASD in 16p11.2 and 22q11.2 carriers, per locus and pooled by growth direction

Bars = mean ± SE; n under bars; one record per person. Pooled (shaded): overgrowth = 16p11.2 del + 22q11.2 dup; undergrowth = 16p11.2 dup + 22q11.2 del.
Pooled bars are locus-standardised (inverse-variance-weighted locus means), so their gap is the pooled within-locus difference; pooled adj. = fixed-effect meta-analysis of per-locus adjusted effects.
Δ and Welch p = higher-BMI or ASD minus comparison group (pooled: z-test). adj. = regression adjusting for MRI source (A) or cohort, adult, age, age² (B, C). Bold = adj. p < 0.05.
A: Kuldeep MRI table, first scan per subject, BMI tails only; 16p11.2 = SVIP/CIBM (BP4-5) + UKBB, 22q11.2 = Bearden cohort (A-D assumed; no breakpoint field).
B, C: G2MH, Cardiff, SVIP (full v10 series for HC < 18 y), SSC; ASD from G2MH psy_asd, SVIP clinical_asd_dx, SSC probands. Z < 18 y growth references; ≥ 18 y within-sample Box-Cox.
