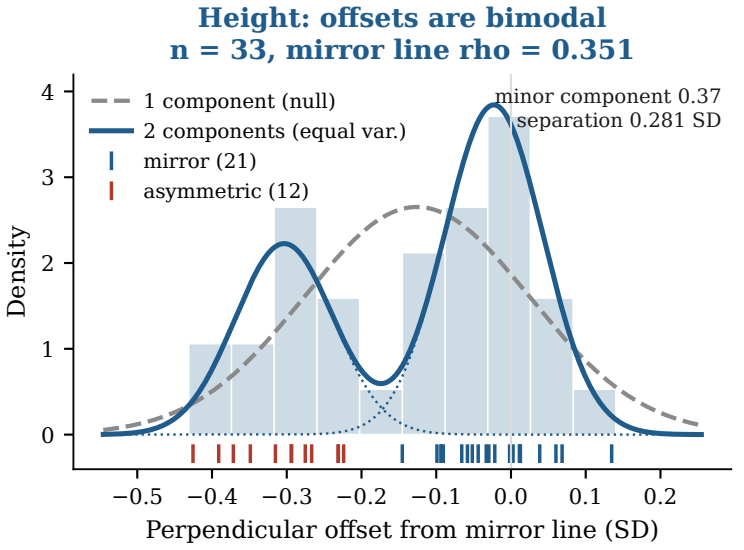
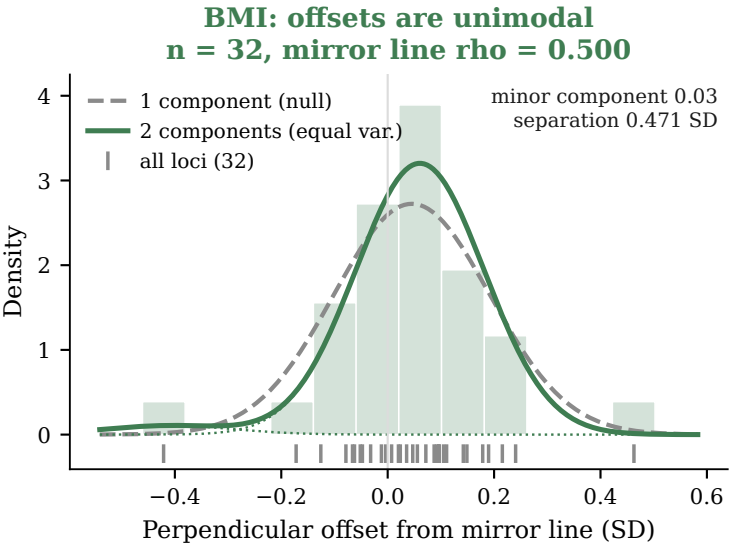
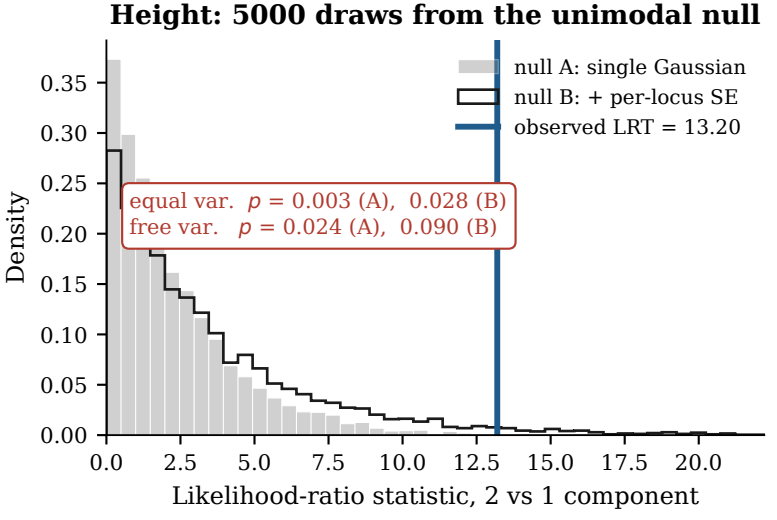
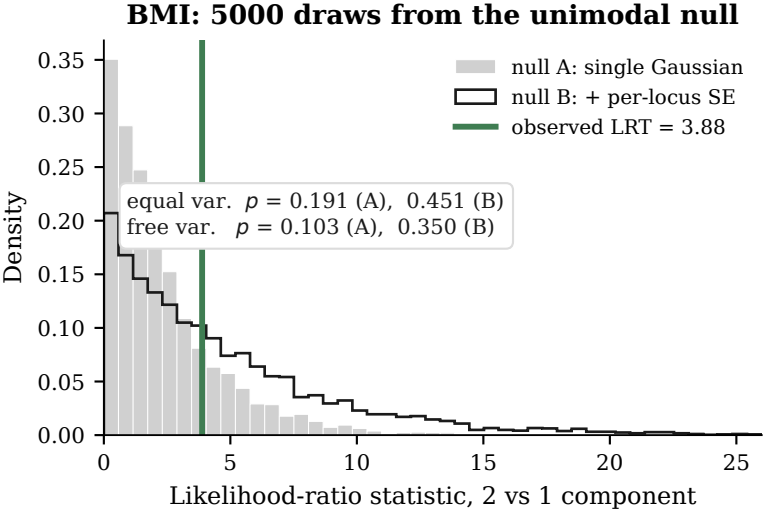
Perpendicular offset from the mirror line: bimodal for height, unimodal for BMI









Mirror line calibrated on the 21 mirror-class height loci, so the 12 asymmetric loci are held out of the fit that defines the line.
The BMI locus table carries no dose-response class, so all 32 loci are used and the two calibrations coincide. Rug shows individual loci.
Null A simulates from the fitted single Gaussian; null B adds each locus's own measurement error. 5,000 replicates, identical EM fitting throughout.
