a Body size at age 10 vs adult BMI group, and adult height

same individuals; box = all, points = all carriers and 600 random non−carriers; diamond = mean; bracket = linear trend per step

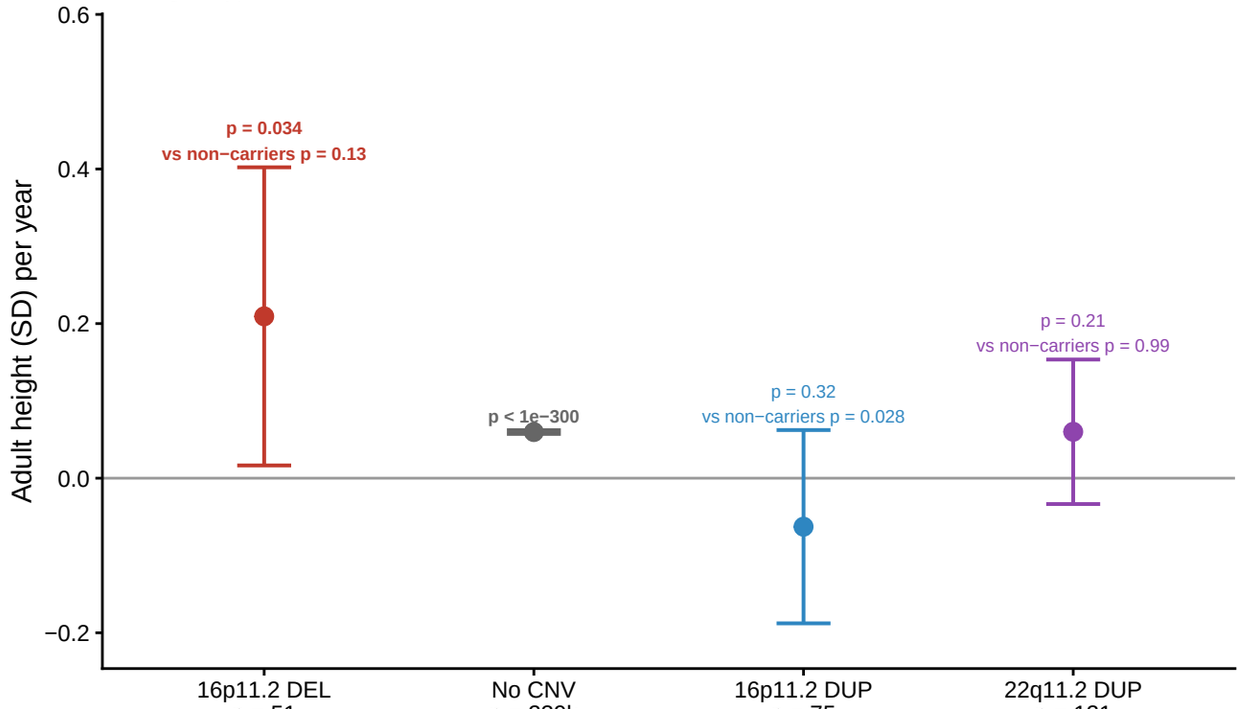

b Age at menarche by genotype

women; difference from non−carriers adjusted for age and PC1−10 (years), diamond = mean

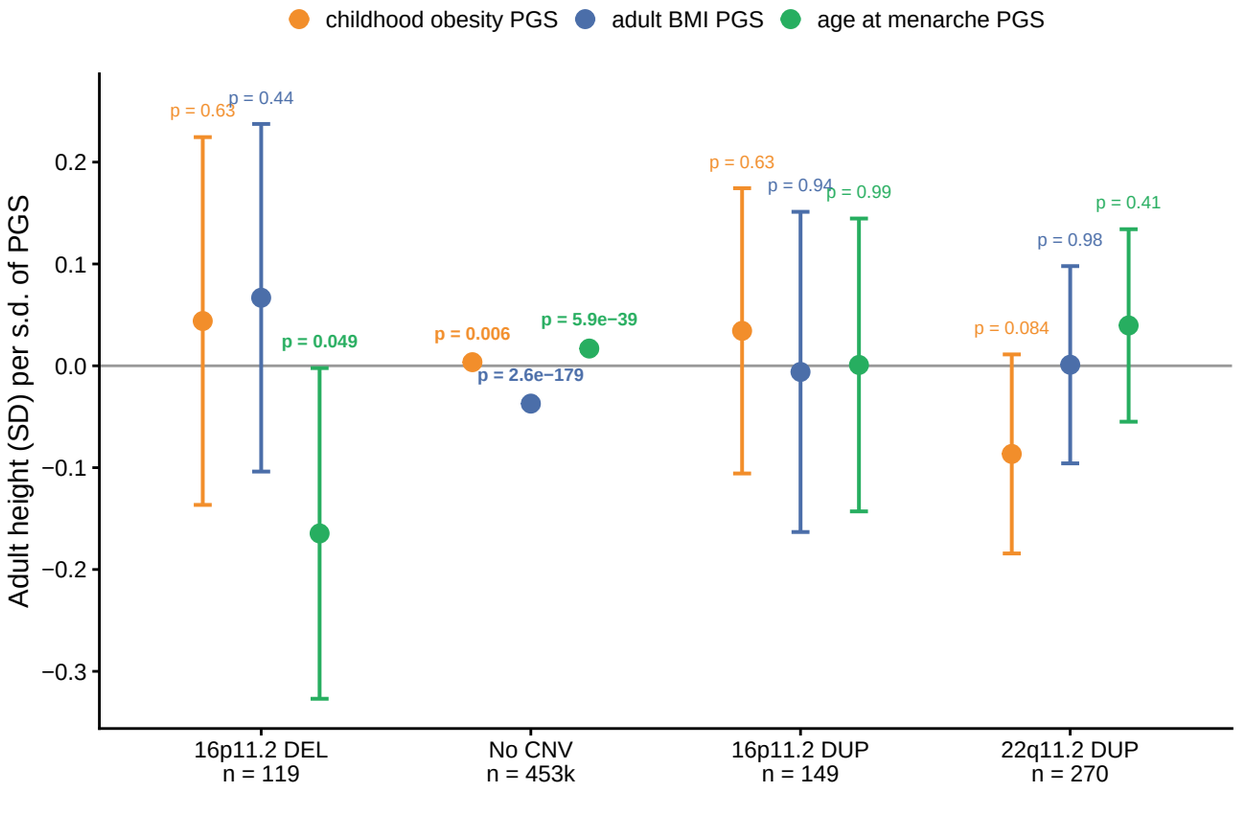

c Later menarche, taller adult

adult height Z per year of later menarche within genotype, 95% CI

d Genetic instruments

adult height per s.d. of polygenic score within genotype, adjusted for height PGS and PC1−10, 95% CI

e Menarche and adult height: observational vs MR

women; adult height Z per year of later menarche, 95% CI; MR first stage in all women 0.24 y per s.d. of PGS (F = 5539)
